

9-STEP GRAY SCALE TEST CHART 16:9 / GAMMA 0,45

TRANSPARENT

Two 9-graduated counter current gray scales are arranged on a gray background ($D = 0.66$), the gray scales are graduated according to a gamma of 0.45 (related to the densities).

Related to the reflection values (brightness): gamma = 2.2, that being exactly the reciprocal value of gamma=0.45.

The output of an optimally gamma-corrected camera yields two 9-graduated counter current linear step signals. The contrast range of the gray scales is 40:1.

The values of the 9-graduated gray scales are as follows:

Step	Density	Transmission in %	Output signal in %
1	0.15	71	100
2	0.25	56	89.8
3	0.37	43	79.5
4	0.50	31	69.3
5	0.66	22	59.1
6	0.84	14	48.8
7	1.07	9	38.6
8	1.37	4	28.4
9	1.80	1.6	18.1

The density values are based on a density of $\text{BaSO}_4 = 0$. Two black fields and a white field are located between the gray scales. The density of the black field is $D > 3.0$ (transmission $< 0.1\%$). The density of the white field is $D = 0.05$ (transmission = 90%).
