

CAMCORDER RESOLUTION TEST CHART

TRANSPARENCY

The TE144 was developed in a private German testing laboratory and serves particularly for evaluating the frequency response of consumer camcorders.

The test chart is subdivided into 18 horizontal fields of bar patterns with different frequencies. The upper field has a frequency of 0.5 MHz and serves as a reference value. The following fields have the frequencies:

1.0, 1.5, 2.0, 2.1, 2.2, 2.3, 2.4, 2.6, 2.9, 3.0, 3.3, 3.6, 3.7, 4.1, 4.4, 4.7, 4.9 MHz

The frequencies are marked on the left and right margins of the image.
